

IN THE SPECIFICATION:

Please replace paragraph [0006] (page 5, line 3 - 13) with the following replacement paragraph:

[0006] According to a preferred embodiment variant the cap, the frangible web and the fixation component are formed as one piece as an injection molded part, wherein then the fixation component after ~~pacing~~ placing on the cap is firmly connected to the connection end of the syringe by way of welding. With a suitable design of the fixation component and of the connection end of the syringe, the welding procedure may be carried out in a simple manner, since no particular demands are may with regard to tolerances. By way of a circumferential weld seam one may manufacture such a stable bond between the fixation component and the connection end of the syringe that even with an unfavorable dimensioning of the frangible web it is always ensured that the break-off location is formed by the frangible web and not by other components or the weld seam.

Please replace paragraph [0025] (page 10, line 14 - 19) with the following replacement paragraph:

[0025] The tamper-evident closure which is formed in this manner is provided for a syringe which is not prefilled or for a syringe filled with pasty substances. For opening the closure, the cap 3 is removed from the cylinder section 5 by way of hand force, wherein the frangible web 4 is broken. The arrangement and design of the cylinder section 5 with regard to the Luer connection 2 is selected such that a Luer lock connection is formed after removal of the cap 3.
